

# **USR-K5 User Manual**

File Version: V1.0.1

## Features

• 10 / 100Mbps adaptive Ethernet interface, support AUTO-MDIX network cable crossover and direct connection automatic switching.

- Work modes:TCP server, TCP client, UDP server, UDP client.
- Baud rate can be set from 600bps to 230.4Kbps. Parity supports None, Odd, Eben, Mark, Space.
- Customize heartbeat package and keep the connection real and reliable, can be used to detect the dead connections
- Customize registration package, detect the connection status, and also customize the head of package.

• In TCP Server mode, the number of connected clients can be modify from 1 to 4, default is 4. The IP of connected client can be displayed on the web page interface. And the data sent / received data is calculated according to the connection.

• In TCP Server mode, when the client number reach the max value, can set whether the new client kicks the old one.

• Support web page, AT command, serial port protocol, network protocol setting parameters, provide setup protocols for customers to integrate into their software.

- Support TCP client short connection, the time can be set.
- Support timeout restart function, the time can be set.
- Before TCP connection is established, whether to clear the data cache can be set.
- Support DHCP, get IP automatically.
- The unique MAC address in the world, can be modified.
- Support DNS, domain name resolution.
- Support customize the address of DNS server.
- Support upgrade the firmware from web page, more convenient.
- Support V-com.
- Support software and hardware restore to the factory setting.
- Support across the gateway, switching and router.
- Support work in LAN, also can access the external.

- 6. One PC

### 1.1.1. Hardware connection

To test a serial port to network communication conversion, we will K5 (USR - K5, referred to as "K5, similarly hereinafter) serial port via a serial port line (or turn the USB serial port) connected to the computer, the K5 with cable front-end ports and connected to the front-end ports of the PC, hardware connection without error, access our distribution power adapter, to power a K5, connection diagram as shown:

Figure 2 Hardware connection

### 1. 1. 2. Network test environment

In order to prevent the customer in the application of the server search, ping, and open web pages and other problems. After the hardware connection is complete, check the computer for the following before using it.

- 1) close the computer firewall (generally found in the control panel) and anti-virus software;
- 2) close the network card irrelevant to this test and keep only one local connection;

3) for the case where the server is directly connected to PC, a static IP address in the same network segment as K5 IP must be set for the computer;

Figure 4 Software settings

#### 1. 1. 4. Data transmission test

After the above steps are confirmed to be correct, the two-way communication between the serial port and the Ethernet port can be carried out. The operation steps are as follows:

1) open the Test software usr-tcp232-test.exe, and connect the hardware according to figure 1.2.

2) select TCP Server mode in the network setting area, input the computer IP address of the Server, input the port number of the Server 8234, click to start listening, establish the TCP connection, set the baud rate of the serial port to 115200, set the serial port parameter to None/8/1, click open, and open the serial portAt this point, we can conduct data transceiver test between the serial port and the network. The data flow from the serial port to the network is as follows:

computer serial port ->K5 serial port ->K5 Ethernet port -> computer network;The data flow from network to serial port is as follows: computer network ->K5 Ethernet port ->K5 serial port -> computer serial port is shown in the figure below

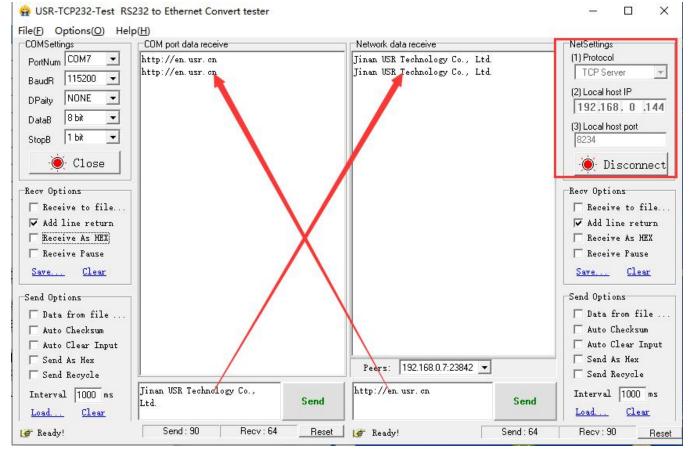

Figure 5 Data transmissions

### 1.2. Basic Parameters

USR-K5 is a tiny size serial port to Ethernet module which can realize the bi-direct data transparent transmission between RJ45 port and TTL serial port. It can be applied to RS232 and RS485 by level conversion circuit.

Supports low power consumption, only consume a little current in full speed work. Equipped with Cortex-M0 core, fast speed and high efficiency. Supports several functions to meet more needs.

K5 is easy to operate and have strong compatibility. On the basis of adding new functions, it is compatible with the setting protocol of K1, K2, which provide convenience for old users. At the same time, a setting protocol similar to K3 is added. Customers using the K3 setup protocol can apply to K5 with a simple adjustment.

	Parameters	Value			
	Working voltage	DC3.0~3.6V			
	Working current	175mA@3.3V			
Hardware	Net port	RJ45, 10/100Mbps,AUTO-MDIX			
parameters	Serial band rate	600~230.4K(bps)			
	Serial Level	TTL-3.3V			
	Network protocol	IP, IPV4, TCP/UDP, ARP, ICMP			
	IP type	Static IP, DHCP			
	DNS	Support			
	User parameters	Protocol setting, web setting, AT command			
	Transparent transmission	TCP Server/TCP client/UDP Server/UDP Clie			
	Similar RFC2217	Support			
Software parameters	TCP server connection	Default 4 and maximum is 4			
parameters	Net buffer	Send:2Kbyte; receive:2Kbyte			
	Serial port buffer	Receive: 1Kbyte			
	Average transmission rate	<10ms			
	Setup software	USR-VCOM, setup software, USR-Cloud test			
		software			
	Package mechanism	4 bytes package time and 1024 bytes			
		package length			
	Certification	CE,FCC			
	Size	35.0x19.4x16.55 mm(L*W*H)			
	Operating temp.	-40~+85°C			
	Storage temp	-45~+105°C

	Storage humidity	5%~95% RH		
	Package	Electrostatic bubble		

### 1.3. Product Function

Here are the functions of K5, below is the overall block diagram.

### 1.4. IP Mode

IP address/ Mask/ Gateway

1. IP address is the identity representation of the module in the LAN, which is unique in the LAN, so please be sure there is no another device same as it in the LAN.

### 1. 4. 1. Static IP

The static IP needs to be manually set by the user. During the setting process, pay attention to write the IP, mask, and gateway at the same time. The static IP is suitable for scenarios where IP and equipment need to be counted and one-to-one correspondence is required. Pay attention to the corr/espondence between IP address, mask and gateway when setting. When using a static IP, you need to set each module and ensure that the IP address is not duplicated with other network devices in the LAN.

### 1.4.2. DHCP

Get IP address , gateway address, DNS server and other information from the gateway server to easy the step for setting IP address, DHCP adopted to the environment that have no special requirement to IP.

Advantage: accessing the device equipment with the DHCP server such as router can communicate directly. Reduce the hassle of setting IP address and subnet masks.

Disadvantage: accessing the device with no DHCP server such as computer directly, K5 can not work.

2. Subnet masks used to determine the host number and the network number, indicates the number of subnet and determine the flag within the subnet. The subnet masks needed to set, usually we use the subnet masks: 255.255.255.0, the network number is the former 24, the holder name is the last 8, number of subnet is 255, the module IP is in the range of 255, and then we are sure that the module IP is in this subnet.

3. Gateway is the net port of the LAN. If you connect the router to access the internet, the gateway is the router IP address, setting wrong and can not access into the net. No device such as router and no setting, keep the default.

4. Related AT command.

Diagram 3	Related AT Command

### 1.5. Configuration by Windows Utility

You can easily install and configure your device server over the network In this section, we will cover only the "configuration of general settings" using N510 Administrator. For more detailed information on how to use this suite of useful utilities, refer to <u>Chapter 3</u> and **5**.

### 1.5.1. Installing M0 Set-up software

Download and run (<u>https://www.usriot.com/support/downloads/usr-m4-setup-software-v235102.html</u>). You may find it in the Resource section under your product page.

#### 1.5.2. Searching for Device Servers over a LAN

The Broadcast Search function is used to locate all K5 device servers that are connected to the same LAN as your computer. Since the Broadcast Search function searches by MAC address and not IP address, all device connected to the LAN will be located, regardless of whether or not they are part of the same subnet as the host.

In M0 software, click Search to search your LAN for device servers. When your unit appears in the search results, You may also wait a few more moments for the search to complete.

				Save Config

Right-click your unit in the Configuration screen and select Configure in the menu. The device server must be assigned a unique IP address that is valid for your network. Both static and dynamic IP addresses are supported. The ptype you can check the details

Consult with your network administrator if you are not sure how to set these parameters. You also can set different work mode via the right side menu.you can check the details refer to <u>Chapters 2</u> for a detailed explanation of different operating modes and parameters.

### 1. 6. Configuration by web console

### 1. 6. 1. Connect with Network

Connect one end of the Ethernet cable to the 10/100M Ethernet port and the other end of the cable to the Network .The device will indicate a valid connection to the Ethernet in the following ways: Open your browser

User can connect PC to N510 through LAN port and enter Web Server to configure.

Web Server default parameters as follow:

Diagram 2 Web server default parameters

Parameter	Default settings
Web server IP address	192.168.0.7
User name	admin
Password	admin

### 1. 6. 2. Web page server

After firstly connecting PC to K5, user can open browser and enter default IP 192.168.0.7 into address bar, then log in user name and password, user will enter Web site:

K5 is same as the normal web page server, which is convenient for user to setting parameter and query the status.

The port of web page can be setting, default is 80.

Steps:

- > Open the browser, fill the IP of K5, e.g.:192.168.0.7(IP address and PC in the same net segment.)
- Fill the user name and key word in the login web page, default is admin, click to enter.
- TX Count: the data count sent from K5 to the external

RX Count: the data count received by K5 from thee net.

Remote IP/TX/RX:via it, you can see the device connected to the K5, and the sent count and received count.

The Serial Settings page is where you set the serial communication parameters for each device port. Settings include baud rate, parity, and flow control. according to the direction of the dial code switch refer to **Serial port** 

**functions** for a detailed explanation of Serial-port.And you also can set the different work mode that refer to **chapter 3**.

### 1. 6. 4. DNS Server Address

DNS servers are used to convert domain names into IP addresses that are recognized by the network. DNS server address can be set, which can realize domain name resolution in the case of imperfect local domain name server. Users can also set the address of specific DNS server according to requirements. When K5 needs domain name resolution, it will submit the resolution request to the DNS server set. Using is more flexible and reliable.

In static IP mode, the default DNS server address is 208.67.222.222, and in DHCP mode, the DNS server address is obtained automatically. Version 4015 above support domain name server address can be set.

#### 1. 6. 5. Short Connection

The aim to use this function is to save the resource of the server, usually used in the points to one point. Using the short connection can sure the current connection is the useful one, no extra control tools to screening.

USR-LTE-7S5 User Manual

technical support: h.usriot.com

TCP short connection can sued in the TCP client, open it and send message. The connection will be broken automatically.

This function default disable, the interval of disconnect can be configured after enable it, the range from 2 to 255s, default is 3s, the diagram is as fellow:

Current Status	parameter		
Local IP Config	Heartbeat Packet Type:	None V ASCII V	
Serial Port	Register Packet Type:	Enable USR Clour	
expand Function	DeviceId:		
Misc Config	Communication Code:		
Reboot	Impersistent Connection:		
	Disconnect Time:	3 (s)(2~255)	
	TCP Server-kick off old connection:	✓	
	Buffer Data Before Connected:		
	UART Set Parameter:		

Figure 12 Disconnect Time

### 1. 6. 6. Clear Buffer Data

If the TCP have no connection, the data that serial received will be placed in the cache, and the K5 serial port can receive 1K byte, after the TCP built, you can select is clear the cached data.

Default disable. Under the Httpd client mode or the TCP client mode, enable the short connection and this function do not work.

Current Status	parameter			
Local IP Config	Heartbeat Packet Type:	None   ASCII

	UART Set Parameter:			

Figure 13 Clear Buffer Data

### 1. 6. 7. Restart Timeout

Restart timeout is to make sure the long and stable work of K5, when the net port or network can not receive data for long time, K5 will restart out the setting time to avoid abnormal conditions affect the connection. Time for restart can set in the webpage. The normal work time of this function set 60~3600s, default is 3600s. if setting time less than 60s, default to be 0 and turn off this function. The setting is as fellow:

Current Status	parameter			
Local IP Config	Module Name:	USR-K5		
Serial Port	Webserver Port:	80		
Expand Function	Username:	admin		
Misc Config	Password:	admin		
Reboot	MAC Address:	A6-4C-5E-00-F7-39		
	Max Clients Connect To TCP Server:	4 (1~16)		
	Reset Timeout:	3600 (s) (0, 60~3600)		
	Save	Cancel		

Figure 14 Restart Timeout

#### 1. 6. 8. The number of the connected client

USR-K5 works in the TCP server mode, the max number of client to connect is 4, default is 4, the max number can be configuring as you want, which is be convenient for using. When the the number connecting clients more than 4, we should control the total data flow in 2.5KB/s if we need to send and receive meanwhile(not more than 200 bite/s).

If the number is 16 now(e.g. the number you set is 4), default use the new link instead of the older one, also you can set to use the older one. The webpage are as fellow.

Current Status	parameter	Current Status	parameter

	Max Clients Connect To TCP Server: 4 (1~4) Reset Timeout: 3600 (s)(0,60~65535) Save Cancel		CP Server-kick off old connection: Buffer Data Before Connected: UART Set Parameter: Save Cancel

Figure 15 Setting parameters

#### 1.6.9. Link

Link pin can be used as indication pin for TCP connection status. When connected, it output low level; When

unconnected, high level. When K5 is under TCP model, Link pin will pull down. otherwise, it stays in high level. When K5 is under DUP model, Link pin will always pull down. By default, it is not checked.

#### 1. 6. 10. **Reset**

Reset used when the K5 fly or crash and can not built the normal connection, so can not work. Reset to initialize the module to resume normal operation.

When working as TCP Client, K5 connects to TCP Server actively. When start Reset function, K5 try to connect to TCP Server for 30 times. If failed, K5 will restart automatically. By default, it won't be chose.

#### 1. 6. 11. Index

Index is to resolve the problem that under TCP server mode, K5 can not divide the data sources or send data to special client when user have more than 2 client to connect the K5.

At most there can be 16 links when the K5 in the TCP server mode. The max number can set from 1to 16 as you want. Here we take the default number is 16 as example. Server send data to 16 clients, or the server receive the data from 16 clients, open the Index, mark to divide the different clients and user can recognize the data sources according to the mark, meanwhile send different data to special clients.

Figure 16Index Software Setting

1.After the server receive data, output 'I' 'N' data..... to user MCU via server serial port. I means receive; N means the data from which index ranging from 31 to 40 in hexadecimal.

2.User MCU fill 'O' 'N' data.....via the server serial port, O means output, N means using which Index to sending, K5 server send data from serial port to net client port.(note o refers to the character "o"in ASCII and N is the character N, such as 1,2, etc)

3.K5 server port input 'C' 'N' 'M' to user MCU when the new TCP connected, means the current one is the

number N and on total there are M .

4. When there are 16 client to connected, if there is new connection to ask, input F,F to MCU.

5.Break off it, K5 server input 'D' 'N' 'M' to user MCU, N means the original number of connections deleted, and remaining M connections.

Data transmission as the below:

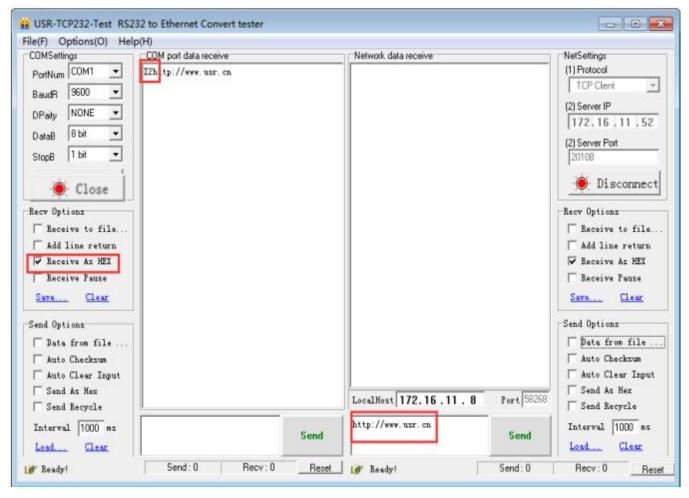

Figure 17 Transmissions test

### 2. Security consideration

### 2.1. Restore to the Factory Setting.

1) Hardware restore: K5 supports the hardware restore to the factory setting. Keep putting down reload pin 5s in powered condition, the put up and it will restore.

**Steps:** power on  $\rightarrow$  keep the reload pin down  $\rightarrow$  keep for 5s  $\rightarrow$  put up.

- 2) Software restore: via the software setting and the net protocol sending command.
- 3) AT command restore: enter the AT command, AT +RELD to restore.

### 2.2. Network Upgrade Firmware

Web page upgrading firmware, stable and simple. Using this new function meets the custom requirement. If you need to upgrade, you can query us from the USR support: http://h.usriot.com and asking firmware from supply. The way to upgrade please reference <u>Chapter 5 Setting software setting parameters</u>

### 3. Configurations for Network and Serial port

There are five work modes for K5, including TCP Client, TCP Server, UDP Client, UDP Server and Httpd Client. Setting from the web page and the software setting, as below:

Current Status		🖶 USR-MO V2.2.4.287 📃 🖸 💽

### 3.1. TCP Client

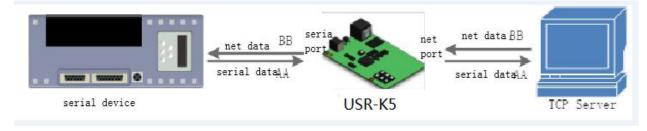

Figure 19 **TCP Client** 

It has to be connected before transferring data.

1) In TCP Client Mode, K5 connects TCP Server actively, establish a connection to transmit date. According to the TCP protocol related rule, there difference for TCP client between connect and disconnect, to make sure the data exchange more stable. Usually used in the data interaction between device and server, which is the most common form of network communication.

2) In TCP Client Mode, support the function of identifying disconnected link. When connected, it will send keepalive package every 15s. If unconnected, it can be detected timely and enforce K5 to disconnect the former link to establish a new one.

3) When K5 try to connect remote server, if the local port number is not "0", it will establish a connection with the same source port every time.

4) Support synchronizing baud rate, USR-cloud and short connection function.

5) In a LAN, if the K5 is static IP, please keep K5 IP stay in the same network segment with gateway, and setting the gateway IP, otherwise can not work as normal.

6) note:keepalive, synchronizing baud rate and USR-cloud are more on the below.

7)Communication example

① Software setting, take the K5 as a TCP client, remote IP:192.168.0.201,(for my PC is 172.16.11.8, so for the next testing ,change remote IP to 172.16.11.8) remote port:8234, then save it. Research to make sure the parameters are right. Also you can set work mode, remote IP and remote port in the webpage then save and restart.

### 3.2. TCP Server

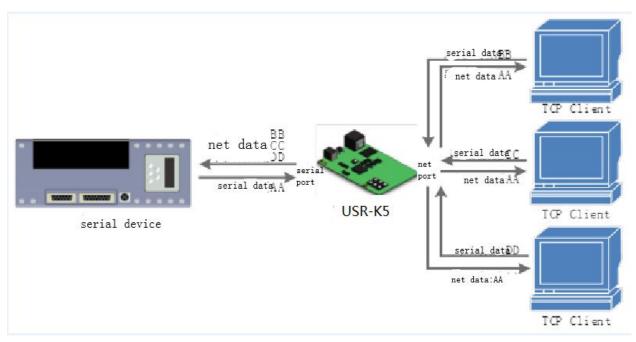

Figure 23 TCP Server

1) In TCP Server Mode, K5 listens local port, it will response and establish a connection when there is a request. When the K5 receive the data, it will send it to all the client connected to K5, meanwhile, this mode can monitor the connect timely with keep alive function.

2) Usually it is used in the LAN communicating with TCP client. Adopt the case that more than one PC or phone asking data without server. Same as the TCP client ,there are different between connect and disconnect.

3) Support synchronizing baud rate.

4) TCP Client number is from 1 to 16, default value 4. the port is fixed., can not be set to 0.

5) If the number of the TCP client is more than 16, default kick the old one, and this function can be set via web page.

6) TCP server example

① Set K5 as a TCP server via software setting, local port is 20108, then save. Also you can set via web page.

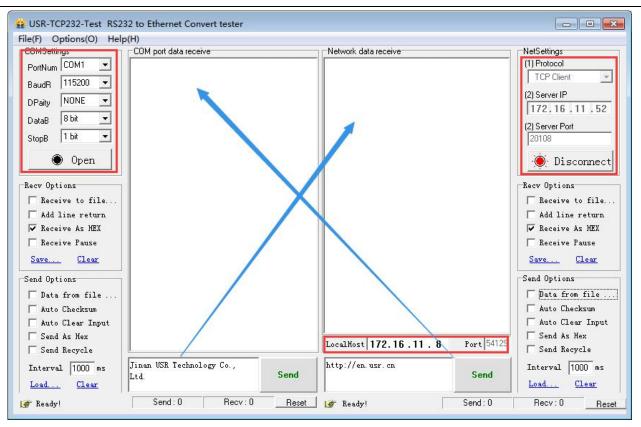

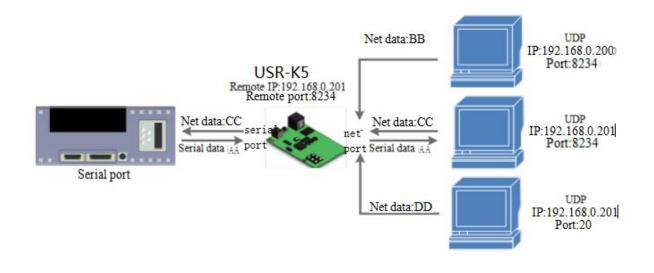

Figure 26 **TCP Server Testing** 

### 3. 3. UDP Client

- Figure 27 UDP Client
- 1) The Model belongs to UDP Protocol.
- 2) In UDP Client Mode, TCP232-K5 won't establish the connection actively.
- 3) It can communicate with the target port whose IP has been set. If data doesn't come from this channel, it

#### will not be accepted by TCP232-K5.

4) In UDP Client Mode, if target IP is set as 255.255.255.255, it can realize function of entire network broadcast, also can receive broadcast data. 4015and the later vision support broadcast. e.g.xxx.xxx.255.

#### 5) Example

#### ① Set the K5 as UDP client, remote port 8234

Figure 29 UDP Client Web page Setting

② Set the testing software as UDP, local IP is the IP of the PC, local port is the remote port for K5, the connect. Setting the correct serial parameters and click to open the serial.

③ Send the send of the serial and receive the data, testing software remote IP and remote port change into the IP and port of K5, then click the net send, send data to serial port.

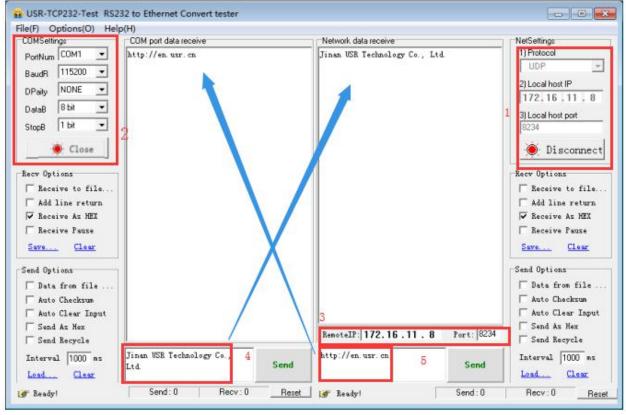

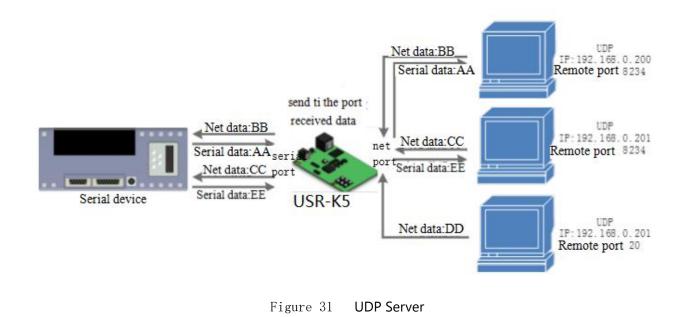

Figure 30 UDP Connection Testing

### 3.4. UDP Server

1) UDP server is a IP address do not verify the resource in the normal UDP. After receive every UDP package, change the target IP into data resource IP and port. When sending data, sending to the least IP and port.

2) Usually this mode, several net device communicate with module and do not want to use TCP for high frequency.

3) Example:

① Set the K5 as UDP server, local port is 20108

② Open the testing software, choose UDP and the local IP is IP of the PC, set the ports to be different, e.g. 23 and 8234 in the below diagram, then click.

Figure 32 Basic Parameters

Serial port basic parameters including: baud rate; data bits; stop bits; parity.

1.Baud rate: communicating speed of serial port, can be set from 600~230.4Kbps, support random baud rate.

2.Data bits:the range of it from 7, 8.

3.Stop bits:can set from 1 to 2.

4. Parity: support none, odd, even, mark and space

Via the serial port parameters, keep the parameters of the K5 and device consistent to permit the normally communication.

### 3. 5. 2. Serial Port Framing

Since the data on the network is transmitted in the unit of data frames, it is necessary to send the frame data via serial port to the network, so as to transmit data more efficiently and quickly.K5 packages serial port data according to fixed packaging length and packaging time during data transmission.The default K5 packaging time is 4 bytes of packaging time and 400 bytes of packaging length.

The frame mechanism of serial port is based on the packaging time and the packaging length.

1. Serial port packaging time: the default is 4 bytes of send time.

The default package time of K5, the interval that serial port receive time more than 4 bytes packaging time, K5 packaging sending. E.g. baud rate is 115200K time for 4 bytes is 0.4ms, if the value less than 0.1ms, the package time calculate as 0.1ms. A formula to calculate as fellows:

#### T=1/baud rate\*10\*4

2. Serial port package length: default package length is 400 bytes

When K5 receive data from webpage, and then send to serial port. For the limited of the serial speed, the user need to control the flow, otherwise data overflow problems can be occur and drop the package. So when send data from network to serial port, please calculate the flow.

Calculate way: if sending M bytes need N s. the way to check for possible overflow methods (if the net situation is ok, the time can be ignored ). The time for M bytes:

#### T=1/baud rate\*10\*m

If there is no overflow, M bytes of data must be transmit within Ns, then N>2T is require for K5 to work properly.

### 3. 5. 3. **RFC2217**

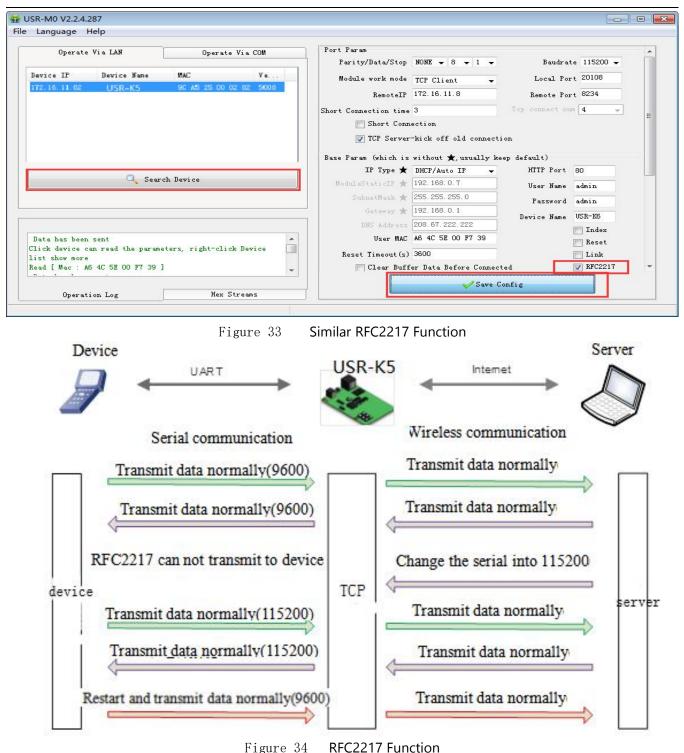

Similar RFC2217 is a simple RFC2217 protocol, working with the VCOM and changing serial port parameters to realize the communication with variable serial port parameters.

Enable this function, using USR-VCOM can open this function, which can realize the serial baud of the PC software and K5 automatically match. No need to pay attention to serial port baud rate setting.

USR-LTE-7S5 User Manual

technical support: h.usriot.com

Modify the serial port baud rate from 115200bps to 9600bps. FRC2217 can be set using software or webpage, default is enable.

This function modify from RFC2217, promote the certainty for transmission. Length is 8 bytes.detailed note and the protocol content are as fellows(e.g. value is HEX).

① Send the protocol to the device, if the requirements are met, the serial port parameters shall be set, and no transparent transmission, if there is something wrong, the data package will be forwarded through the serial port as ordinary data.

USR-LTE-7S5 User Manual

technical support: h.usriot.com

② TCP Client, TCP Server, UDP Client, UDP Server and radio support this function.

③ The modify of this order effect in time, do not restart. Effective during this operation cycle, will not save, power loss.

name	Package head	Baud rate	Median	Parity sum

### 4. Advanced Function

### 4.1. Heartbeat Package

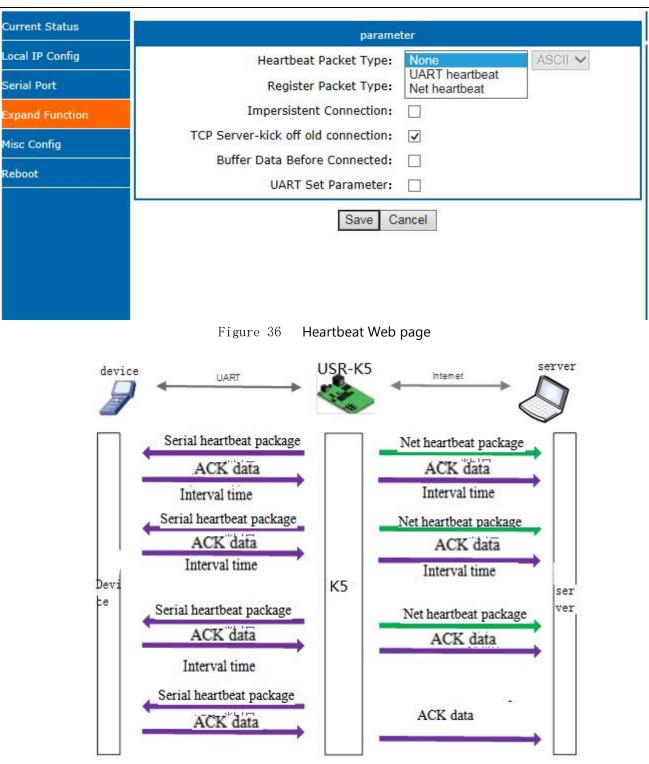

In the transparent transport mode, user can choose K5 to send heartbeat package. Heartbeat package can be sent to net server, also can send to serial port, but can not send in the same time.

Sending to the net aimed at connecting with server, effect only in TCP client and UDP client.

In the application of the server sending fixed query command to device, to reduce the communication flow. The user can choose using the serial port to send the heartbeat package instead of the heartbeat from server. 4015 and the later vision support heartbeat package. The longest content is 40 bite.

technical support: h.usriot.com

# 4.2. Registration package

In the transparent transport mode, user can choose K5 to send registration package. Registration package is

used to identify data sources or do as the code to get the server authorization.

Registration package can be sent when the K5 built connection with server, also can installed in the head of the data package, as a data package. Registration package data can be MAC address or customize registration package data, where the custom registry setting content is up to 40 bytes.

The connection setting and sending registration package is mainly used to connect the server that needs to be registered. The application diagram is as follows:

Figure 38 Building the Connection to Send Registration Package

Data carries the registration package: sending data in the front of the data access to the registration package, mainly for protocol transmission application diagram is as follows:

# 4. 3. USR IOT CLOUD

USR IOT CLOUD for equipment manufacturers, engineering providers to provide a one-stop solution. It includes features such as cloud configuration and cloud detection.

Cloud configuration can complete the Internet of things system with the functions of terminal equipment data collection, real-time control, alarm push, group management, configuration design and so on.

Cloud detection can complete the remote configuration parameters, firmware upgrade, working status and network abnormal alarm.

#### 4. 3. 1. Scada cloud

In this chapter,I will show you how to make connection between USR IOT CLOUD and N510 and the collection use MODBUS.

Attend the IP address USR IOT Cloud: <u>https://mp.usriot.com</u> You need to register an account first, and then log in to this platform.

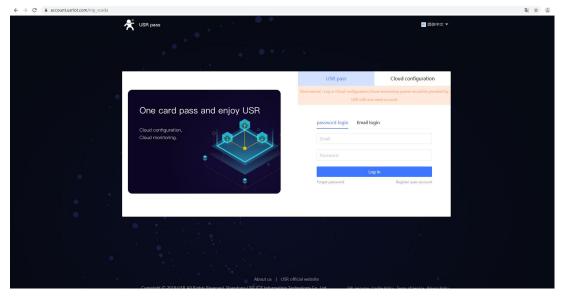

Figure 41 Log in

#### After logging in, add the data template :

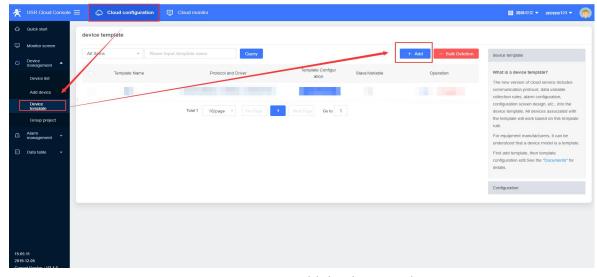

Figure 42 Add the data template

Note: What's the difference between edge computing and cloud collection?

Edge calculation: data collection and analysis are carried out by the networking module, and then reported to the cloud according to certain rules. Suitable for high frequency (second level) acquisition application scenarios, local high frequency acquisition after reporting to the cloud, cloud data storage and display.

Products supporting edge computing: PLCNET series, G780V2 (after firmware version V1.1.0)

Cloud collection: the host in the cloud polls the terminal equipment according to a certain rule. The networking module only does data transmission and converts serial port signal into network signal and sends it to the cloud. Suitable for low frequency (minute level) acquisition scene.

technical support: h.usriot.com

#### Nest step add slave name and protocol :

Press "save" and the new device will appear in the device list, and we can press view in order to check the default ID and password.Next, we open the M4 Set-up software or Web server to set some parameters: Remote server to be connected is: tcp.mp.usriot.com. Port number: 15000.

Enable USR Cloud: Fill in the ID and password obtained from the cloud platform.

If you need to change the serial port parameters, you can change them in the setup software.

After setting the parameters, click save and restart the device.

# 5. Serial to Ethernet

Receive the data assigned VCOM data, and send it in the data of net data using VCOM to solve the PC as a serial port and can not connect with device, which is convenient for users.

User can download VCOM software from:

https://www.usriot.com/support/downloads/usr-vcom-virtual-serial-software.html.

Figure 51 Virtual com software

Through this software user can set up connection between k5 and virtual serial to solve the problem that traditional equipment PC software used in serial port communication way.

The specific operation is as follows:

Set the k5 parameter :Set the work mode TCP Client ,Address and port is 192.168.0.144 and 8899.

Operate	e Via LAN	Operate	Via COM	Base Paran (which is	vi thoat 🗙 asually k	eep default)

# 6. Parameter Setting

This character mainly to introduce how to setting the K5 parameters and achieve their own personalized application through parameter settings

Including setting software setting parameter, web page setting parameter and serial setting parameter. User setting steps:

Modify the user name and password  $\rightarrow$  setting the access way to the IP address  $\rightarrow$  serial parameter  $\rightarrow$  the related parameters for working method.

To ensure the normal using of software, the following steps are necessary

1. When using setting software to setting parameter, K5 and the PC of the setting software are in a LAN.

2.Close the antivirus software and firewall software.

3.Close the irrelevant network card.

# 6. 1. Net Protocol Setting Parameters

#### 6. 1. 1. Setting Software Setting Parameters

Open the software setting and click search.

Download link: https://www.usriot.com/support/downloads/usr-m0-setup-software-v224288.html Search all the K5 in the LAN, including current IP, device name, MAC and version of the K5.

## 6. 1. 2. Setting Protocol Setting the Parameters

We set special protocol on the net setting. To be convenient to set across the net, all communication protocol adopted UDP mode, the lower is in front. When setting, make sure the remote port is 1500 for UDP communication, the local port is random and all the communication protocol using UDP.

- 1. Net setting parameters steps
  - ① Built socket:

Build a UDP socket, remote IP :255.255.255.255, remote port:1500, lower is in front.

- ② Setting command steps
- > Send searching order on the internet.
- > K5 return the IP address, MAC, device name and version.
- > Net port read the parameter that K5 returned.
- Combine the MAC address the username, password and the parameter that need setting to be a setting command.
- Send setting command and restart.
- K5 return setting right.
- Restart command.
- > The return command of K5 right (wrong).
- 2. Net setting command content

Net setting protocol command means upper send command via net to modify the protocol command of the

#### module or the server.

① Command query

Diagram 8 Command Query

function	Packag e head	length (order~ parameters bit)	order	MAC (6 bits)	Username and password (12 bits)	parameters	Parity (sum)
search	FF	01	01	-	-	-	02
restart	FF	хх	02	[MAC]	[usrname] [password]	-	хх
Read setting	FF	хх	03	[MAC]	[usrname] [password]	-	хх
basic setting	FF	хх	05	[MAC]	[usrname] [password]	basic parameters	xx
serial port 0 setting	FF	хх	06	[MAC]	[usrname] [password]	serial port parameters	хх
reset	FF	хх	0b	[MAC]	[usrname] [password]	-	хх
USR-cloud	FF	хх	0с	[MAC]	[usrname] [password]	serial port parameters	хх
Heartbeat/ registration package setting	FF	хх	21	[MAC]	[usrname] [password]	serial port parameters	хх
Httpd URL setting	FF	хх	22	[MAC]	[usrname] [password]	Httpd URL	xx
Httpd package head setting	FF	хх	23	[MAC]	[usrname] [password]	Httpd package head	хх
Extend setting	-	-	-	-	-	-	-

To make sure the accuracy of the command, we setting the algorithm and check of sending command in protocol: the parity is sum parity: begin at the length add to the first digit of the parity. The sum is the value to parity, and reserve the lower bits.

② Search command

Search command is: FF 01 01 02, parity sum 02 = 01 + 01.

③ Restart command

Send (22 bits ) FF 13 02 D8 B0 4C 46 35 CA 61 64 6D 69 6E 00 61 64 6D 69 6E 00 40, parity sum: 40 = 13 + 02 + ... + 6E + 00, from 4th to 9th is the address of the MAC, the last 12 bits in front add the parity is the user name and password. These are 6 bits, add 0 if less than 6 bits.

Note: the last one of the username and password is 0, below are same.

#### ④ Read setting command

Send (22bits): FF 13 03 D8 B0 4C 46 35 CA 61 64 6D 69 6E 00 61 64 6D 69 6E 00 41, parity sum: 41 = 13 + 03 + ... + 6E + 00, from 4th to 9th is the address of the MAC, the last 12 bits in front add the parity is the user name and password. These are 6 bits, add 0 if less than 6 bits.

5 Basic parameter setting command

Basic setting command including 67 basic parameters. Setting For better Settings, here are some examples: sending: FF 56 05 D8 B0 4C 46 35 CA 61 64 6D 69 6E 00 61 64 6D 69 6E 00 95 63 03 00 00 00 50 00 00 07 00 A8 C0 01 00 A8 C0 00 FF FF FF 55 53 52 2D 4B 32 00 00 00 00 00 00 00 00 00 61 64 6D 69 6E 00 61 64 6D 69 6E 00 00 01 00 E0 D8 B0 4C 46 35 CA 00 00 00 00 00 00 00 00 59, parity bits is still parity sum algorithm: 59 = 56 + 05 + D8 + ... + 03: from 4th to 9th is the address of the MAC, from 10th to the 22th is the username + password, the latter bits is fixed length basic setting parameters. The last bit is the parity sum.

#### Diagram 10 Serial Port Parameters

#### ⑦ Restore to factory command

Send: FF 13 0B D8 B0 4C 46 35 CA 61 64 6D 69 6E 00 61 64 6D 69 6E 00 49: parity sum: 49 = 13 + 0b + ... + 6E + 00: from 4th to 9th is the address of the MAC, from 10th to the 21th is the username + password, These are 6 bits, add 0 if less than 6 bits.

8 USR IOT Cloud command

Parity sum: 07 = 13 + 0c + ... + 6E + 00+...+00:

From 4th to 9th is the address of the MAC, from 10th to the 21th is the username + password, These are 6 bits, add 0 if less than 6 bits. The later are the USR IOT Cloud ID and password of device, the last one is parity.

(9) Heartbeat/registration package command

Parity sum: C2 = 68 + 21 + ... + 6E + 00+...+00:

From 4th to 9th is the address of the MAC, from 10th to the 21th is the username + password. These are 6 bits, add 0 if less than 6 bits. The later are sending direct of heartbeat package and registration package, heartbeat time0, length of the heartbeat, length of registration package, heartbeat package, registration package, heartbeat package and registration package. These are 40 bits, add 0 if less than 40. The last one is parity.

Name	Bits	E.g.	Instr
H_R_uc Flags	1	00	<ul> <li>Heartbeat registration package mark:</li> <li>1th is 1: send heartbeat package to net port</li> <li>2th is 1: send heartbeat package to serial port;</li> <li>3th is 1: connected sending to registration</li> <li>package:</li> <li>4th is 1: data carry registration package:</li> <li>5th is 1: Httpd information drop package head</li> <li>6th is 1: serial port setting parameters function</li> <li>on</li> <li>7th is 1: heartbeat package hexadecimal input</li> <li>8th is 1: registration package hexadecimal</li> </ul>
heart_times	2	00 1e	Heartbeat time
heart_len	1	00	Length of heartbeat package
register_len	1	00	Length registration package
heartbeat	40	00 00 00 00 00 00 00 00 00 00 00 00 00	Heartbeat package content
register_s	40	00 00 00 00 00 00 00 00 00 00 00 00 00	Registration package content

#### Diagram 11 Heartbeat Registration Package Net Setting

① HTTPD client header setting

#### Setting URL protocol

Diagram	12	URL Protocol	
---------	----	--------------	--

Name	Bits	E.g.	Instr
url_len	1	00	Length of Httpd URL
httpd_send_url	100	00	Httpd Client URL

Parity sum: C9 = 78 + 22 + ... + 3F + 00+...+00:

From 4th to 9th is the MAC address of the module, the later 12 is username and password, these are 6 bits add 0 if less than 6, the last one is parity.

Setting package setting

#### Diagram 13 Package setting

name	Bits	E.g.	instr
head_lenn	1	00	Length of Httpd Client
httpd_send_btemp	200	00	Httpd Client package head

Parity sum: CF = DC + 23 + ... + 65 + 00+...+00:

From 4th to 9th is the MAC address of the module, the later 12 is username and password, these are 6 bits add 0 if less than 6, the last one is parity.

3. Net return the command

① The result of search command return

The result of search command return( 36 bits): FF 24 01 00 00 c0 a8 00 07 00 71 77 7c 42 2F 01 0c 00 00 55 53 52 2d 4b 32 00 00 00 00 00 00 00 00 00 F2,

Parity way is reduce parity sum, the initial value is 0x00, reduce every bits in order, algorithm is as fellow: F2 = 00 - FF - 24 - 01 - 00 - 4B - ... - 32 - 00 - ... - 00.

#### Diagram 14 Return Command

name	bits	E.g.	Instr
TAG_STATUS	0	FF	fixed number

technical support: h.usriot.com

Packet_length	1	24	fixed number
CMD_DISCOVER_TARGE T	2	01	fixed number
Board_type	3	00	fixed number
Board_ID	4	00	fixed number
Client_IP_address	5~8	C0 A8 00 07	device IP( higher in front )
MAC_address	9~14	AC CF 23 20 FE 3D	device MAC( higher in front )
Firmware_version	15~18	01 00 00	Firmware version
Application_title	19~34	55 53 52 2D 4B 32 00 00 00 00 00 00 00 00 00 00	device name
checksum	35	FO	(this value can be ignore) Check sum initial value is 0x00, reduce every bits of TAG_STATUS in order,till the last bit, and the result is checksum.

2 Restart command return result

Respond (4 bits): FF 01 02 4B if the password right 4B = 'K'

FF 01 02 50 username password wrong 50 = 'P'

③ Read order command return result

The return are all the parameters, total 576, no parity and protocol, return parameters directly. Method of reading reference "basic parameters chart" "serial parameters chart" and USR-cloud function, heartbeat registration package function and Httpd Client package head setting. Return divide into 4 package, including 130 bits, 50bits, 85 bits and 302 bits.

password fault: FF 01 03 50, the return data have no parity. 4 Basic parameters setting command return result Setting correct return: FF 01 05 4B if the password right 4B = 'K': FF 01 05 50 username password wrong 50 = 'P'. (5)Serial parameters setting command return result Setting correct return: FF 01 06 4B if the password right 4B = 'K': FF 01 06 50 username password wrong 50 = 'P'. 6 USR-cloud parameters setting command return result Setting correct return: FF 01 06 4B if the password right 4B = 'K': FF 01 06 50 username password wrong 50 = 'P'. (7)Heartbeat registration package parameters setting command return result Setting correct return: FF 01 06 4B if the password right 4B = 'K': FF 01 06 50 username password wrong 50 = 'P'. (8) Httpd URL setting command return result Setting correct return: FF 01 22 4B if the password right 4B = 'K': FF 01 22 50 username password wrong 50 = 'P'. (9)Httpd package head command return result Setting correct return: FF 01 23 4B if the password right 4B = 'K': FF 01 23 50 username password wrong 50 = 'P'. (1) Other return Parity and return: return 'E' + right value: Correct perform: FF 01 CMD'K': Username password wrong return: FF 01 CMD'P': Other wrong return: FF 01 CMD'E'. 4. Message monitoring method

If you want to get some real message using the way as below: the tool is setting softwareUSR-MO:

# 7. AT Command

AT command is used for controlling module. You can use AT command to configure and query the settings. Later we will interpret the type in detail.

#### 7. 1. 1. AT Command Overview

AT+ command is the command collection that perform the command transport using UART and module under the order mode. Later we will interpret the type in detail.

Powered successfully, we can setting the module with UART.

The default UART port parameters of the module are: baud rate1152000, no parity, data 8 and stop 1.

#### Instr

AT command test tools.UART interface recommend to use secure CRT software tool or USR pro APP. Below are using the secureCRT with UART to perform.

From transparent transport to order mode need two step as below:

- ➢ Fill "+++"in the UART. After the module receive the "++++", it will send a "a" to confirm;
- > Fill the confirming "a" in the UART, after the module receive and send "+ok", enter the command mode.

Ŧ
4 ⊳

Figure 68 Enter the AT Command

**Instr:** if no feedback after fill "++++" and "a", as the above.

Fill "+++" and "a" need to achieve in the time to reduce the chance of entering command mode while working normally accidentally. Detail requirement are as fellows.

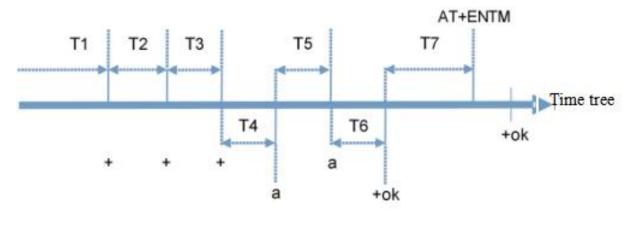

Figure 69 Time Tree

Time requirement:

T1>the interval of serial port package

T2<50ms

T3<50ms

T5<3s

The order change into temporary command mode from transparent transport mode:

1. Serial mode device send "+++"to module continuously. The module receive and send "a" back. Before sending"+++"is the packaging time and can not send any data.

2. After receive "a" feedback a "a"in 3s.

3. After the module receive "a, send "ok" to the device, and enter "AT" command

4. After the device receive "+ok" and know the module enter the AT command mode, then send AT command.

The order change into net transparent transport from AT command mode:

1.Serial device send "AT+ENTM" to module.

2.After the module receive the command, feedback "+ok", then back to the previous working mode.

# 7. 1. 2. AT Command Error Code

Error code	Instr
-1	Invalid format
-2	Invalid order
-3	Invalid operator
-4	Invalid parameter
-5	Not allow

Error Code List

# 7. 1. 3. AT Command

Num	command	Instr
1	E	Enable/disable the echo function
2	Z	restart module
3	VER	Query the vision
4	ENTM	Exit AT command mode
5	RELD	Reset default settings
6	MAC	Query module MAC address
7	WEBU	Setting/ query username and password
8	WANN	Setting/ query WAN port parameters
9	DNS	Setting/ query DNS server address
10	WEBPORT	Setting/ query webpage port
11	UART	Setting/ query serial parameters
12	SOCK	Setting/ query SOCK parameters
3	TCPSE	Setting/ query whether kick off order connection
14	SOCKLK	Query TCP connect status
15	SOCKPORT	Setting/ query local port number
16	RECEN	Setting/ query RFC2217 enable
17	PDTIME	Query the product time
Registrat	ion package function	
18	REGEN	Setting/ query registration package mechanism
19	REGTCP	Setting/ query registration package perform mechanism
20	REGCLOUD	Setting/ query USR-cloud username and password
21	REGUSR	Setting/ query the content of registration package that customized
Heartbea	it package	
22	HEARTEN	Setting/ query heartbeat package enable
23	HEARTTP	Setting/ query method of the heartbeat package send
24	HEARTTM	Setting/ query the heartbeat package time
25	HEARTDT	Setting/ query customize heartbeat package

technical support: h.usriot.com

Expand	function command	
26	SCSLINK	Setting/ query the indicating function of the status of socket connection
27	CLIENTRST	Setting/ query the TCP client mode reset function enable/disable
28	INDEXEN	Setting/ query index function
29	SOCKSL	Setting/ query short connection function
30	SHORTO	Setting/ query short connection time
31	UARTCLBUF	Setting/ query clear serial port cache before module build connection
		function enable/disable
32	RSTIM	Setting/ query timeout reset time
33	MAXSK	Setting/ query maximum client connections in TCP server mode
34	MID	Setting/ query module name
35	SEARCH	Search the port and key words in the LAN
36	Н	Query help message

AT Command

# 7.1.4. AT Command Details

# 7.1.4.1. **AT+E**

Function: query/ setting module echo of the AT command setting Format: query:

```
A+E<CR>
```

```
<CR><LF>+OK=< on/off><CR><LF>
```

setting:

A+E=< on/off ><CR>

<CR> <LF> +OK <CR> <LF>

Parameters: ON: enable the echo, echo the command entered by the AT command.

OFF: under AT command mode, the entered command do not echo.

E.g.: AT+E=0N

## 7.1.4.2. AT+Z

Function: restart module Format: setting:

```
AT+Z<CR>
<CR><LF>+OK<CR><LF>
```

Parameters: none

<note>: after perform this command correctly, module restart and exit the AT command mode.

#### 7.1.4.3. AT+VER

Function: query module firmware version. Format: query: AT+VER<CR> <CR><LF>+OK=< ver ><CR><LF>

Parameters: ver: query module firmware version.

### 7.1.4.4. AT+ENTM

Function: exit the AT command mode and enter the transparent transmission: Format: setting:

AT+ENTM<CR>

<CR><LF>+OK<CR><LF>

Parameters: none

<note>: after perform this command correctly, module change into command mode from transparent transmission mode.

### 7.1.4.5. AT+RELD

```
Function: module reset
Format: setting:
AT+RELD<CR>
<CR><LF>+OK<CR><LF>
```

parameters: none.

## 7.1.4.6. AT+MAC

```
Function: query module MAC
Format: query:
AT+MAC<CR>
```

<CR><LF>+OK=< MAC ><CR><LF>

parameters: mac: MAC address of the module( e.g.00020K2050A )

#### 7.1.4.7. AT+WEBU

Function: setting /query module username and password Format: query: AT+WEBU<CR>

```
<CR> <LF> +OK = < username, password > <CR> <LF>
```

setting:

```
AT+WEBU=< username,password ><CR>
```

```
<CR> <LF> +OK <CR> <LF>
```

Parameters: username: username, support 5 bytes at longest and can not be none:

password: password, support 5 bytes at longest.

E.g.: AT+WEBU=admin,admin

#### 7.1.4.8. **AT+WANN**

Function: setting /query the IP of WAN( DHCP/STATIC ) that module access Format: query:

```
AT+WANN<CR>
```

```
<CR><LF>+OK=< mode,address,mask,gateway ><CR><LF>
```

setting:

AT+WANN=< mode,address,mask,gateway > <CR>

<CR> <LF> +OK <CR> <LF>

Parameters: mode: web IP mode ( static/DHCP )

static: static IP

DHCP: dynamic IP( address,mask,gateway parameters ignore )

address: IP address

mask: subnet masks

gateway: gateway address

E.g.: AT+WANN=static,192.168.0.7,255.255.255.0,192.168.0.1

#### 7.1.4.9. AT+DNS

Function: setting /query DNS server address:

Format: query:

```
AT+DNS<CR>
<CR><LF>+OK=< address ><CR><LF>
setting:
AT+DNS=< address ><CR>
<CR><LF>+OK<CR><LF>
Parameters: address: DNS server address( default value is 208.67.222.222 ).
```

E.g.: AT+DNS=208.67.222.222

#### 7. 1. 4. 10. **AT+WEBPORT**

Function: setting /query webpage port

Format: query:

```
AT+WEBPORT<CR>
<CR><LF>+OK=< port ><CR><LF>
setting:
AT+WEBPORT=< port ><CR>
<CR><LF>+OK<CR><LF>
```

Parameters: port: module the port of the web server that built in of module. default 80: E.g.: AT+WEBPORT=80

#### 7. 1. 4. 11. **AT+UART**

Function: setting /query UART interface parameters

Format: query:

AT+UART<CR>

```
<CR> <LF> +OK = < baudrate,data_bits,stop_bit,parity,flowctrl > <CR> <LF>
```

setting:

AT+UART=< baud rate,data\_bits,stop\_bit,parity,flowctrl ><CR><LF>

<CR><LF>+OK<CR><LF>

Parameters: baudrate: baud rate600~460800bps,can be customized .

```
data_bits: data 5、6、7、8

stop_bits: stop 1、2

parity: parity

NONE( no parity )

EVEN(even parity )

ODD( odd parity )

MASK(1 parity)

SPACE( 0 parity )

Flowctrl: flow control( none flow control, can not setting , default setting to be the NFC )

NFC: none: hardware flow control

FCH: have hardware flow control

FCR: software flow control

E.g.: AT+UART=115200,8,1,NONE,NFC
```

#### 7. 1. 4. 12. **AT+SOCK**

```
Function: setting /query web protocol parameters format
Format: query:
AT+SOCK<CR>
<CR><LF>+OK=< protocol,IP,port ><CR><LF>
```

setting:

AT+SOCK= < protocol, IP, port > < CR>

#### <CR> <LF> +OK <CR> <LF>

#### Parameters:

Protocol: protocol type, including TCPS is TCP server TCPC is TCP client UDPS is UDP server UDPC is UDP client HTPC is Httpd Client IP: when the module setting into "CLIENT" mode, the IP address and domain name of the remote

server.

Port: local port under Server mode and remote port under Client mode, decimal number and less than 65535.

E.g.: AT+SOCK=TCPC,192.168.0.201,8234

#### 7. 1. 4. 13. **AT+TCPSE**

Function: module is TCP Server, the processing mechanism after the connection reaches the maximum number of connections.

Format: query:

```
AT+TCPSE<CR>
<CR><LF>+OK=< status ><CR><LF>
setting:
```

AT+TCPSE=< status ><CR> <CR><LF>+OK<CR><LF>

Parameters:

Status: setting status keep/kick

keep: after reach the maximum number of connection, do not receive new one.

kick: after reach the maximum number of connection, delete the order one and connect the new

one.

E.g.: AT+TCPSE=keep

#### 7. 1. 4. 14. AT+SOCKLK

Function: query whether the TCP has connected Format: query:

```
AT+ SOCKLK<CR>
```

```
<CR><LF>+OK=< sta ><CR><LF>
```

Parameters:

Sta: built the TCP connection or not Connect: TCP connected Disconnect: TCP not connected

## 7. 1. 4. 15. **AT+SOCKPORT**

Function: setting /query local socket port Format: query:

AT+SOCKPORT<CR>

<CR><LF>+OK=< sta ><CR><LF>

setting:

AT+ SOCKPORT =< sta ><CR> <CR><LF>+OK<CR><LF>

Parameters:

Sta: 0 is using port randomly. 1-65535 is using the local port of the socket. E.g.: AT+SOCKPORT=20108:

#### 7. 1. 4. 16. **AT+RFCEN**

```
Function: enable/ disable RFC221 7function

Format: query:

AT+RFCEN<CR>

<CR><LF>+OK=< status ><CR><LF>

setting:

AT+RFCEN =< status ><CR>

<CR><LF>+OK<CR><LF>

Parameters:

status:

ON: enable RFC2217function
```

OFF: disable RFC2217 function

E.g.: AT+RFCEN=ON

#### 7. 1. 4. 17. **AT+PDTIME**

```
Function: query produce time
Format: query:
AT+PDTIME<CR>
```

<CR><LF>+OK=< time ><CR><LF>

Parameters:

time: produce time, e.g.: 2016-10-18 11:20:02

#### 7. 1. 4. 18. **AT+REGEN**

```
Function: setting query registration package mechanism
Format: query:
AT+REGEN<CR>
<CR><LF>+OK=< status ><CR><LF>
setting:
```

AT+REGEN = < status > <CR> <CR> <LF> +OK <CR> <LF>

Parameters:

status:

MAC: enable registration package mechanism, registration package is 6 bites MAC Usr: customize registration package Off: disable registration package mechanism

E.g.: AT+REGEN=MAC

#### 7. 1. 4. 19. **AT+REGTCP**

Function: setting query tcp client mode registration package perform mechanism Format: query:

```
AT+REGTCP<CR>
<CR><LF>+OK=< status ><CR><LF>
setting:
AT+REGTCP =< status ><CR>
<CR><LF>+OK<CR><LF>
```

Parameters:

Status:

first: send a registration package when connected the server at first time

every: add a registration package in front of the every data package sent to server.

all: send registration package when first connected to the server and add registration package in front of the data package.

E.g.: AT+REGTCP=first

#### 7. 1. 4. 20. **AT+REGCLOUD**

Function: setting /query USR-cloud username and password Format: query:

```
AT+REGCLOUD<CR>
<CR><LF>+OK=< name, password ><CR><LF>
setting:
```

```
AT+REGCLOUD= < name, password > <CR>
<CR> <LF> +OK<CR> <LF>
```

Parameters:

Status:

name: USR-cloud device port:

password: USR-cloud password .

#### 7. 1. 4. 21. **AT+REGUSR**

Function: setting query customize registration package content Format: query:

```
AT+REGUSR<CR>
```

<CR><LF>+OK=< data ><CR><LF>

setting:

AT+ REGUSR =< data ><CR>

 $<\!CR\!><\!LF\!>\!+OK\!<\!CR\!><\!LF\!>$ 

Parameters:

data: ASCII code in 40 bytes

E.g.: AT+REGUSR=www.usr.cn

#### 7. 1. 4. 22. **AT+HEARTEN**

Function: setting /query enable or not heartbeat package Format: query:

```
AT+ HEARTEN <CR>
<CR><LF>+OK=< status ><CR><LF>
setting:
AT+ HEARTEN =< status ><CR>
```

```
<CR><LF>+OK<CR><LF>
```

Parameters:

Status: ON:enable heartbeat package Off: disable heartbeat package

E.g.: AT+HEARTEN=ON

#### 7. 1. 4. 23. **AT+HEARTTP**

Function: setting /query heartbeat package send way Format: query:

#### AT+ HEARTTP <CR>

<CR><LF>+OK=< type ><CR><LF>

setting:

AT+ HEARTTP =< type ><CR> <CR><LF>+OK<CR><LF>

Parameters:

Status: NET: send heartbeat package to server COM: send heartbeat package to serial port

E.g.: AT+HEARTTP=NET

#### 7. 1. 4. 24. **AT+HEARTTM**

```
Function: setting /query time of heartbeat package
Format: query:
```

AT+ HEARTTM <CR>

```
<CR><LF>+OK=< time ><CR><LF>
```

setting:

```
AT+ HEARTTM =< time > <CR>
<CR> <LF> +OK <CR> <LF>
```

Parameters:

Time: heartbeat time ,default is 30s, range from 1 to 65535s. E.g.: AT+HEARTTM=30

#### 7. 1. 4. 25. **AT+HEARTDT**

Function: setting query customize heartbeat package content Format: query:

```
AT+ HEARTDT <CR>
<CR> <LF> +OK= < data > <CR> <LF>
setting:
AT+ HEARTDT = < data > <CR>
<CR> <LF> +OK <CR> <LF>
```

Parameters:

data: less than 40 bytes ASCII code. E.g.: AT+HEARTDT=www.usr.cn.

#### 7. 1. 4. 26. AT+ SCSLINK

Function: setting /query Socket connected status instructions function (connection status instructions pin

```
change or not according to the connection status)
Format: query:
AT+ SCSLINK <CR>
<CR><LF>+OK=< sta ><CR><LF>
setting:
AT+ SCSLINK =< sta ><CR>
<CR><LF>+OK<CR><LF>
Parameters: sta: status
ON: enable link function
OFF: disable link function
```

E.g.: AT+ SCSLINK=ON

## 7. 1. 4. 27. **AT+ CLIENTRST**

Function: setting /query TCP Client mode filed to connect several time and reset ( repeat 30 times connection failed, module restart )

Format: query:

```
AT+ CLIENTRST <CR>
<CR><LF>+OK=< sta ><CR><LF>
setting:
AT+ CLIENTRST =< sta ><CR>
<CR><LF>+OK<CR><LF>
Parameters: sta: status
ON: enable TCP Client reset function
OFF: disable TCP Client reset function
```

```
E.g.: AT+CLIENTRST =ON
```

#### 7. 1. 4. 28. **AT+ INDEXEN**

### 7. 1. 4. 29. **AT+ SOCKSL**

```
Function: setting /query short connection function
Format: query:
AT+ SOCKSL <CR>
<CR><LF>+OK=< sta ><CR><LF>
setting:
AT+ SOCKSL =< sta ><CR>
<CR><LF>+OK<CR><LF>
Parameters:sta: status
ON: enable short connection function
OFF: disable short connection function
E.g.: AT+SOCKSL =ON
```

#### 7. 1. 4. 30. AT+ SHORTO

```
Function: setting /query short connection time
Format: query:
AT+ SHORTO <CR>
<CR> <LF>+OK=< time > <CR> <LF>
setting:
AT+ SHORTO = < time > <CR>
<CR> <LF>+OK<CR> <LF>
Parameters: time: short connection time, 2-255s
E.g.: AT+SHORTO =3
```

## 7. 1. 4. 31. AT+ UARTCLBUF

Function: setting /query if the module clear the serial port cache before connected Format: query:

```
AT+ UARTCLBUF <CR>
<CR> <LF> +OK=< sta > <CR> <LF>
setting:
AT+ UARTCLBUF =< sta > <CR>
<CR> <LF> +OK <CR> <LF>
Parameters: sta: status
ON: clear the serial port cache before connected
```

OFF: do not clear the serial port cache before connected

E.g.: AT+UARTCLBUF =ON

#### 7. 1. 4. 32. **AT+ RSTIM**

```
Function: setting /query restart timeout
Format: query:
AT+ RSTIM <CR>
<CR> <LF>+OK=< time > <CR> <LF>
setting:
AT+ RSTIM =< time > <CR>
<CR> <LF>+OK<CR> <LF>
Parameters: time: short connection time: 0, 60-65535s
E.g.: AT+RSTIM =3600
```

#### 7. 1. 4. 33. AT+ MAXSK

Function: setting /query the maximum number of the client that TCP Server connected Format: query:

```
AT+ MAXSK <CR>
```

```
<CR><LF>+OK=< num ><CR><LF>
```

setting:

AT+ MAXSK =< num ><CR>

<CR><LF>+OK<CR><LF>

Parameters: num: the maximum number of the client that TCP Server connected, range from 1 to 16 E.g.: AT+MAXSK =4

#### 7. 1. 4. 34. **AT+ MID**

```
Function: setting /query module name
Format: query:
AT+ MID <CR>
<CR><LF>+OK=< name ><CR><LF>
setting:
AT+ MID =< name ><CR>
<CR><LF>+OK<CR><LF>
```

Parameters: name: module name, maximum 15 bytes and can not be none. E. g.: AT+MID =USR-K5

#### 7. 1. 4. 35. **AT+SEARCH**

Function: search the port and key word in the LAN Format: Query:

AT+ SEARCH <CR> <CR><LF>+OK=<port, data><CR><LF> Setting: AT+ SEARCH = <name> <CR> <CR><LF>+OK<CR> <LF> Parameters: port: search the port in the LAN using the AT command, default is 48899, changing from 0~65535 Data: search the key word in the AT command, default is www.usr.cn at most for 20 bytes E.g. AT+ SEARCH =48899, WWW.USR.CN

#### 7. 1. 4. 36. **AT+ H**

Function: help Format: query: AT+ H <CR> <CR> <LF>+OK=< sta ><CR> <LF> Parameters: sta: help information
